

[SN 2012ds](#) (A.R. 16 23 45.92, Dec. +09 47 12.3), scoperta il 16 luglio 2012 nella galassia pgc 58009 (offset 12E 5S), magnitudine 17.4.

SN scoperta da F. Ciabattari ed E. Mazzoni con il telescopio Newton da 50cm dell'Osservatorio di Monte Agliale (Lucca).

<http://www.cbat.eps.harvard.edu/index.html> Prepared using the Tamkin Foundation Computer Network SUPERNOVA 2012ds IN PGC 58009 = PSN J16234592+0947123 F.

Ciabattari, E. Mazzoni, and M. Rossi, Borgo a Mozzano, Italy, report their discovery of an apparent supernova (mag 17.4) on unfiltered CCD images (limiting magnitude 19.5) obtained on July 16.97 and 17.85 UT with a 0.5-m Newtonian telescope in the course of the Italian Supernovae Search Project. The new object is located at R.A. = 16h23m45s.92, Decl. = +9d47'12".3 (equinox 2000.0; astrometry with respect to UCAC-2 stars), which is 12" east and 5" south of the center of the galaxy PGC 58009. Nothing is visible at this position on the discoverers' images of the same field from June 2010 (limiting magnitude 19.0). The variable was designated PSN J16234592+0947123 when it was posted at the Central Bureau's TOCP webpage and is here designated SN 2012ds based on the spectroscopic confirmation reported below. Additional magnitudes reported for 2012ds: 1987 June 28, [20.3 (Digitized Sky Survey, Palomar F plate; via Ciabattari); 1988 June 11, [20.3 (DSS, Palomar J plate; via Ciabattari); 2012 July 17.942, 17.2 (Federica Luppi and Luca Buzzi, Varese, Italy; 0.38-m f/6.8 reflector; position end figures 45s.89, 13".0; reference stars from NOMAD catalogue; image posted at the following website URL: http://www.astrogeo.va.it/pub/TOCP/PSN_P58009.jpg); July 18.263, 17.1 (Joseph Brimacombe, Cairns, Australia; remotely using a 51-cm RCOS telescope + STL11K camera + luminance filter at the New Mexico Skies Observatory near Mayhill, NM, U.S.A.; position end figures 45s.90, 12".9; image posted at URL <http://www.flickr.com/photos/43846774@N02/7600562452/>); July 18.852, R_c = 17.0 (Massimiliano Martignoni, Magnago, Italy; 0.25-m f/10 reflector; position end figures 45s.91, 12".9); July 19.202, 16.4 (L. Elenin, Lyubertsy, Russia, and I. Molotov, Moscow, Russia, remotely taken at the ISON-NM Observatory near Mayhill, NM, USA, with a 0.45-m f/2.8 telescope; limiting mag about 20.0; position end figures 45s.87 +/- 0".12, 12".9 +/- 0".13; reference stars from NOMAD catalogue; image posted at the following website URL: <http://spaceobs.org/images/TOCP/PSNJ16234592+0947123-20120719.png>). L.

Tomasella, S. Benetti, E. Cappellaro, P. Ochner, A. Pastorello, M. Turatto, and S. Valenti, Osservatorio Astronomico di Padova, Istituto Nazionale di Astrofisica, report that a spectrogram of PSN J16234592+0947123 = 2012ds, obtained on July 17.92 UT with the Asiago 1.82-m Copernico Telescope (+ AFOSC; range 340-820 nm; resolution 2.4 nm), suggests that it is a normal type-Ia supernova. Adopting for the host galaxy a redshift $z = 0.03403$ (Falco et al. 1999, PASP, 111, 438; via NED), a comparison with a library of supernovae spectra via GELATO (Harutyuyan et al. 2008, A.Ap. 488, 383) shows that 2012ds is a type-Ia event soon after maximum.
